Location awareness on Messenger

- Implement basic sending and receiving with friend list display
- Location based ice breakers:
    - Weather v1
    - Latest happenings
    - Trending topics in twitter
    - [NONGPS] Do a websearch on his handle and display any prominent news.
    - [NONGPS] Optional : Sports, movies
    - [NONGPS] Fetch most commented/liked status of a particular person from facebook.
    - Keeping track of users visited places.
    - Location based ads.
    - B'days of common friends
- Store user specific preferences(for sports, movies, etc.)
    -

Design

- User logs into our system with his co-ordinates automatically fetched
- On server we do OAuth for that User to allow access to his friends list
- And based on his geo-cordinates we see if all the info is already cached, if not fireup yql and cache it- based on various parameters
- Whenever user hovers on any online friends (who used our interface), it fires up ajax call to check the user's updated info and displays in a popup
